CALNIVO

Privacy, Legal & Trust Audit + Fix Specification

Source-code audit • prioritized corrections • copy-paste implementation prompt

Official site: https://calnivocalc.com

Repository audited: mohammedtech121/Calnivo (main branch)

Audit date: 20 October 2026

EXECUTIVE FINDING

The most urgent issue is not a missing policy page. The code loads Google Analytics 4 globally, while the Privacy Policy contains two contradictory Analytics sections: one says Calnivo does not use analytics, the next says it does. The footer and calculator directory also claim “no data collected” / “no tracking.” These statements must be reconciled with actual behaviour before AdSense review or wider promotion.

Purpose: give the Calnivo team a safe, implementation-ready plan to correct privacy disclosures, terms, disclaimers and related site-wide claims without changing the existing 40 calculators or redesigning the site.

Important limitation: this is a technical and content review, not legal advice or a certification of legal compliance. The source files on the public GitHub main branch were inspected. The production deployment should be checked after changes because its deployed commit/configuration may differ from the repository. No access was available to the owner’s GA4 data-retention settings, Netlify account settings, consent records, or legal entity details.

1. Executive Summary

Overall status: NEEDS CORRECTION before claiming the website collects no data or before introducing advertising. The calculator design can remain privacy-preserving because the calculator values can be processed locally, but this is not the same as saying the website itself has no tracking or processes no technical information.

Priority	Finding	Required action
P0 — Critical	Privacy Policy has conflicting Analytics sections; GA4 is loaded from the root layout.	Keep one accurate Analytics disclosure. Decide on consent behaviour, then ensure code and policy match.
P0 — Critical	Footer says “No data collected”; calculator directory says “no tracking.”	Replace global claims with a narrower, accurate statement about local calculator inputs and disclose hosting/analytics processing.
P0 — Critical	GA4 loads globally with no consent gate visible in the inspected root layout.	Implement a real consent flow and hold analytics loading until applicable consent is granted; do not rely on policy text alone.
P1 — High	Policy says cookies are not used for tracking/advertising, calls GA data “anonymized,” and says Do Not Track works.	Correct these claims; GA4 settings and actual browser behaviour must be verified.
P1 — High	Terms, trust copy and children’s statement contain broad claims that need evidence or narrower wording.	Clarify estimates/limitations; remove unsupported claims such as “safe for users of all ages.”
P1 — High	There is no dedicated disclaimer page; the footer has no disclaimer link.	Add a clear `/disclaimer` page and link it from the footer and relevant calculator pages.
P2 — Before monetisation	No AdSense script was found in the inspected root layout, but the current privacy wording is not ready for ads.	Do not claim AdSense is already active. Before adding ads, update disclosures and implement region-appropriate consent controls.

KEEP THIS DISTINCTION

“Calculator inputs and results stay in the browser” can be an accurate statement about the calculator engine if network testing confirms it. “No data is collected” is not accurate while GA4 is loaded and hosting providers process ordinary connection metadata.

2. What Was Audited

The following repository files were inspected directly on GitHub main:

- `src/app/privacy/page.tsx` — full policy source and duplicate Analytics sections.
- `src/app/terms/page.tsx` — terms of use and disclaimers.
- `src/app/layout.tsx` — global GA4 script and Measurement ID `G-L38QJ6QYWQ`.

- `src/components/layout/Footer.tsx` — footer links and “No data collected” statement.
- `src/app/calculators/page.tsx` — “no backend, no database, no tracking” copy and privacy links.
- `src/components/home/HomePage.tsx` — privacy and calculator-accuracy trust claims.
- `src/app/about/page.tsx` — founders, organisation copy and trust narrative.
- `src/app/contact/page.tsx` — `hello@calnivocalc.com` and GitHub contact route.
- `src/app/sitemap.ts` and `src/app/robots.ts` — current listed pages and crawling directives.
- `next.config.ts` — Content Security Policy allows Google Tag Manager / Analytics hosts.

Not verified in this audit: whether the live production deployment exactly matches this commit; actual GA4 retention and reporting settings; whether any Netlify analytics/logging features are separately enabled; the exact data retention for hosting/email providers; legal operator/entity/address; actual user consent records; cookie behaviour on every supported browser; or a future AdSense configuration. Those must not be invented in the policy.

3. Detailed Findings and Required Fixes

3.1 Privacy Policy — `/privacy`

Severity	Code/content finding	Fix
P0	Two separate sections are both titled “Analytics.” The first says no Google Analytics or third-party analytics; the second says GA4 is used.	Remove the contradictory section. Publish one accurate analytics section that describes the real implementation.
P0	`src/app/layout.tsx` loads `https://www.googletagmanager.com/gtag/js?id=G-L38QJ6QYWQ` and calls `gtag('config', ...)` for every page.	Gate script loading behind a consent decision wherever consent is required. Audit initial page load and SPA navigation after implementation.
P0	The policy says “Cookies for tracking or advertising” are not collected, even though its own second Analytics section says GA4 uses cookies.	Do not claim there is no tracking-cookie use. Describe GA4 cookies/online identifiers accurately and explain user choices.
P1	GA4 usage data is described as “aggregate, anonymized.” Aggregated reports are not the same as all collected data being anonymous at collection.	Use cautious wording: Google Analytics processes usage and technical information and may use cookies/online identifiers; do not promise complete anonymisation.
P1	Policy suggests enabling “Do Not Track” as an opt-out, but the inspected GA setup does not check that signal.	Remove this as a promised choice unless code explicitly detects and enforces it. Do not say an opt-out works unless tested.
P1	“We do not collect any personal information” is overbroad beside GA4, hosting logs and email contact.	Say Calnivo does not ask users to register and does not intentionally transmit calculator inputs/results, if verified. Separately disclose technical usage information and email correspondence.
P1	“Calnivo is safe for users of all ages” is an unsupported blanket assurance.	Remove it. State the actual intended audience and handling practice; do not make a children’s privacy guarantee without a suitable policy and implementation.

Severity	Code/content finding	Fix
P1	No clear retention details are given for GA4, hosting or email.	Read the GA4 property retention setting and describe the real value. Link to provider policies for provider-controlled processing; do not invent a fixed period.
P1	No clear privacy-request procedure other than a generic Contact link.	Name the contact route (`hello@calnivocalc.com` / `/contact`), describe requests that may be made, and say rights depend on applicable law.
P2	Last updated date is August 2026 while source includes a newer GA4 setup.	Update the date only when the revised policy is published; keep the policy aligned with future code/configuration changes.

3.2 Site-wide copy that contradicts the policy

File	Current issue	Required replacement concept
`src/components/layout/Footer.tsx`	Displays “Calculations run in your browser. No data collected.”	Use a precise summary: calculator inputs/results are processed locally; hosting and, if accepted, analytics may process technical/usage information. Link to Privacy.
`src/app/calculators/page.tsx`	Says “no backend, no database, no tracking.”	Remove “no tracking.” “No Calnivo account or calculator-results backend” may be used only if verified; disclose analytics separately.
`src/components/home/HomePage.tsx`	“Privacy first — All math happens in your browser.” This is okay only as a calculator-processing statement, but could imply the whole visit is untracked.	Retain or adjust to “Calculator maths runs in your browser; see our Privacy Policy for hosting and analytics details.”
`src/app/layout.tsx` metadata / descriptions	Site descriptions say “all client-side”; not necessarily wrong for calculation, but incomplete as a privacy promise.	Keep “calculations run locally” if verified. Avoid “no data/no tracking” in metadata.
`src/components/home/HomePage.tsx`	“Each calculator is tested for accuracy.”	Keep only if a repeatable, documented test suite exists for every calculator. Otherwise rewrite as an honest goal and add evidence-based methodology.

3.3 Terms of Use — `/terms`

The existing page already says the calculators are informational and are not financial, medical or legal advice. Keep that core, but strengthen it in these ways:

- Clarify that output values are estimates based on the inputs, formula choices, assumptions and reference dates/tax years displayed on each calculator. A disclaimer does not excuse incorrect formulas or misleading output.
- Avoid an unqualified statement that every calculator is regularly tested unless a test log or automated test coverage substantiates it.

- Keep warranty and liability limits qualified by “to the maximum extent permitted by applicable law.” Do not imply that statutory rights can always be waived.
- Add a sensible acceptable-use clause: do not misuse the site, attempt to disrupt it, abuse security controls or use it to violate applicable law.
- Clarify ownership/use of Calnivo branding, text and site design without claiming ownership of user-entered values or third-party material.
- Review the sentence “continued use after changes constitutes acceptance.” Give material changes an effective date and seek legal review of the change process.
- Do not insert a governing-law country, business address, legal entity name or venue without confirming the operator’s actual status and jurisdiction.

3.4 Financial & Health Disclaimer

A dedicated `/disclaimer` page is recommended. Relevant cautions already appear in calculator sidebars and Terms, but there is no dedicated route in the inspected sitemap or footer. The new page should state:

- Financial: estimates are not personalized financial, lending, investment, insurance, or tax advice. Rates, fees, lender rules and tax law vary by location and date. Identify tax year/jurisdiction on the relevant calculator.
- Health: BMI, calorie needs, body-fat estimates, pace and pregnancy-date results are educational estimates, not diagnoses or medical advice. Do not use them as a substitute for a clinician, especially for pregnancy, symptoms, minors or treatment decisions.
- Mathematics and utilities: results depend on input validity, assumptions, units, time zone/date handling and rounding. Verify critical engineering, construction, network and other safety-related values independently.
- No guarantee: explain that actual outcomes can differ and that users should review input units, assumptions and edge cases.
- Do not hide a disclaimer where users cannot see it; provide a concise relevant notice near health and financial calculators and a full page from the footer.

3.5 About and Contact pages

The About page is comparatively clear and names the founders, but the legal operator identity is not specified. The Contact page provides `hello@calnivocalc.com` and a GitHub issue link; this is a useful start.

- Confirm whether Calnivo is operated by the founders as individuals or by a registered entity. Use the true name in privacy and legal pages; do not invent a company or address.
- Use `hello@calnivocalc.com` as the contact for privacy questions unless a dedicated monitored privacy inbox is actually created. Do not publish an invented `privacy@` mailbox.
- Explain that users who email Calnivo necessarily send the contents of their message and sender address through their email provider; process those messages only for replying and handling the request.
- On About, avoid claiming a level of accuracy or review process that has not been evidenced. A short methodology/testing page can document formulas, assumptions, review dates and how users report errors.

3.6 Footer, sitemap and crawlable policy links

- Keep the existing footer links for About, calculator directory, Terms, Privacy and Contact.
- Add a crawlable `<Link href="/disclaimer">Disclaimer</Link>` to the footer after creating the dedicated page.
- Add `/disclaimer` to `src/app/sitemap.ts`. Keep `/privacy`, `/terms`, `/contact` and `/about` listed.
- Link the disclaimer from health and finance calculators and from Terms. Make sure it returns HTTP 200, has a self-referencing canonical and is not `noindex`.
- A separate cookie-policy URL is optional if the Privacy Policy provides complete, understandable cookie and analytics disclosures. A persistent “Privacy settings” link is needed if a consent manager is added.

4. Recommended Privacy Policy Structure and Drafting Rules

Use this as the structure for the replacement page. The developer should write user-facing text in plain English, preserve the site design, and verify each statement against the running code before publishing.

1. Who operates Calnivo. Identify Calnivo, its official domain, the actual responsible operator/entity (after owner confirmation), and `hello@calnivocalc.com` for privacy questions.

2. Calculator inputs and results. State that calculator maths is processed in the visitor's browser and values/results are not intentionally sent to Calnivo or GA4—only after network testing confirms this. Do not generalise that to all website/connection data.

3. Google Analytics 4. Disclose the current GA4 use, the purpose, categories of usage/technical information, cookies or online identifiers, third-party processing and the controls actually implemented. Do not call it fully anonymous.

4. Hosting and security logs. Explain that Netlify/the hosting provider may process IP address, requested URL, browser/user-agent, timestamps and similar connection metadata to serve and protect the site. Link to the provider's current privacy policy.

5. Contact emails. Explain what is processed when visitors email Calnivo and how to submit a privacy request.

6. Cookies and consent choices. List only technologies actually used. Explain Accept/Reject/Manage choices, how preferences can be changed/withdrawn and which scripts are blocked before consent where required.

7. Retention and recipients. State actual configured GA4 retention; for provider-controlled logs and messages, refer to provider policies/settings without promising an unverified deletion schedule.

8. International processing. Describe third-party processors and possible cross-border processing cautiously, after checking current provider terms/settings.

9. Children. Remove blanket "safe for all ages" language. State actual audience/approach and provide a contact route if someone believes personal data was submitted.

10. Privacy rights. Explain how to contact Calnivo. List rights only as applicable under the visitor's jurisdiction; do not promise a particular statutory response deadline without confirming the applicable law.

11. Policy updates. Use a real effective/updated date, describe material changes accurately and re-review whenever Analytics, ads, forms, storage or vendors change.

DO NOT PUBLISH UNVERIFIED PROMISES

Do not state an exact analytics retention period, "all data is anonymous," "we cannot access hosting logs," "Do Not Track disables analytics," "no cookies," or "no data collected" unless the live configuration and code prove the claim. The policy must describe what really happens, not what the site intends to do.

5. Analytics Consent and Future AdSense Requirements

5.1 GA4 is currently hard-coded in the global layout

The inspected `src/app/layout.tsx` contains the GA4 Measurement ID `G-L38QJ6QYWQ`, loads `gtag.js` using Next.js Script and calls `gtag('config', ...)`. No consent gate was visible in that file. `next.config.ts` was also adjusted to permit Google Tag Manager / Analytics resources. This is a real integration in the source, not merely a GA property created in the Analytics UI.

- Recommended conservative approach: add a clear, accessible analytics-consent interface. Do not load `gtag.js` until explicit analytics permission is granted, especially in locations where prior consent is required. If the user rejects analytics, do not load analytics scripts or set analytics cookies.

- Include equally clear “Accept analytics” and “Reject optional analytics” choices; offer a “Manage preferences” option if more than one optional category exists. Provide a persistent “Privacy settings” link so consent can be changed later.
- If the codebase uses Google Consent Mode, configure and test it correctly; Consent Mode alone is not a user consent notice and does not itself obtain consent.
- Track only necessary page-view information. Never pass calculator values/results, health or finance inputs, generated passwords, names, email addresses or sensitive free text as GA events or URL parameters.
- Test single-page/client-side navigation to ensure a page view is not missed or counted twice. Verify real network requests and cookies for accept, reject, withdrawal and first visit.

5.2 Before AdSense is added

The inspected root layout does not show AdSense integration. Do not write the policy as if ads are already served. Before adding AdSense:

- Update the policy to identify advertising, cookies/local storage, online identifiers, IP-related processing and third-party ad technology in line with the exact ad configuration.
- Implement Google’s current consent-management requirements for traffic in the EEA, UK and Switzerland. Google states a Google-certified CMP integrated with the IAB Transparency and Consent Framework is required when serving ads in those regions; check the current requirement and settings at launch.
- Review US state privacy requirements and any other regions actually targeted; implement appropriate notices, choices and opt-outs when required.
- Make sure the privacy policy is easily accessible before ads are deployed and the consent interface actually controls tags; policy updates alone are not enough.
- Re-test Content Security Policy and external resource allowlists when adding a CMP or ads. Add only the domains required by the chosen provider.

6. Suggested Replacement Copy (Use Only After Testing)

The following is a starter draft for key statements, not a complete legal document and not automatically compliant in every jurisdiction. The implementation team must make it match the live website. Add a verified operator identity and configured retention details before publication.

Privacy policy — short summary

DRAFT

Calnivo provides online calculators that perform their calculations in your browser. We do not require an account. Calculator inputs and results are not intentionally sent to Calnivo or to Google Analytics. Separately, the website’s hosting provider may process ordinary connection information to deliver and secure the site. If you consent to analytics, Google Analytics 4 may process information about page visits and device/browser use to help us understand how the website is used. See the sections below for details and choices.

Privacy policy — analytics section

DRAFT — CONFIRM CONFIGURATION

Calnivo uses Google Analytics 4 to measure website usage only when analytics is enabled under the site's consent settings. Depending on the configuration, this may involve page URLs and titles, referrers, page-view events, device/browser information, approximate region and online identifiers or cookies. Google processes this information under its own service terms and privacy documentation. We do not intentionally send calculator input values, calculation results, health or financial details, or generated passwords to Analytics. We do not describe all Analytics data as anonymous. If you reject optional analytics, the Analytics script should not load.

Privacy policy — hosting/contact section

DRAFT

To deliver and protect the website, our hosting provider may automatically process technical request information, such as IP address, requested page, browser/user-agent and timestamps. The provider's own privacy notice and service configuration govern its processing and retention. If you email Calnivo, we receive the sender address and the contents of your message and use them to respond to your request. Contact us at hello@calnivocalc.com for privacy questions.

Site-wide privacy line

REPLACE "NO DATA COLLECTED"

Calculator inputs and results are processed in your browser. Hosting services may process technical connection data; analytics runs only according to your privacy choices. Read our Privacy Policy or change Privacy Settings.

7. Legal and Platform References to Re-check Before Release

This audit is not a legal opinion. These official materials provide the platform/regulatory requirements the team should review while implementing the changes:

Google Publisher Policies — Privacy disclosures: https://support.google.com/publisherpolicies/answer/10437794?hl=en

Google says publishers must disclose data collection, sharing and usage associated with Google services, including cookies, web beacons, IP addresses and other identifiers.

Google AdSense — CMP requirements for publishers: https://support.google.com/adsense/answer/13554116?hl=en

Review current consent-management requirements for EEA, UK and Switzerland before enabling AdSense.

Google — How sites/apps that use Google services share information: https://policies.google.com/technologies/partner-sites?hl=en-IN

Explains that websites using Analytics/advertising services may share page URL, IP address and other information with Google, depending on services/configuration.

MeitY — Digital Personal Data Protection Rules, 2025: https://www.meity.gov.in/documents/act-and-policies/digital-personal-data-protection-rules-2025-gDOxUjMtQWa?pageTitle=Digit

Official Indian framework. Check the current notification and phased commencement schedule; do not assume every provision is already in force as of this audit date.

India Gazette — DPDP Act commencement notification:
https://www.meity.gov.in/static/uploads/2025/11/c56ceae6c383460ca69577428d36828b.pdf

The notification dated 13 November 2025 sets a phased schedule, including an 18-month commencement date for many substantive provisions. Confirm the current legal timeline with counsel.

Google — Crawlable links guidance: https://developers.google.com/search/docs/crawling-indexing/links-crawlable

For the disclaimer footer/sitemap work: use real links with valid hrefs. This is technical SEO guidance, not privacy compliance guidance.

8. Copy-Paste Implementation Prompt for Your Coding Agent

Paste the prompt below into the coding tool connected to the Calnivo repository. Do not publish until the acceptance checklist in Section 9 passes.

Act as a senior Next.js/TypeScript engineer and privacy-by-design reviewer for the existing Calnivo codebase. Implement the privacy/legal/trust audit below in the current repository.

NON-NEGOTIABLE PRESERVATION RULES

- Keep the existing Calnivo design system, responsive UI, navigation, URL routes, and all 40 calculators fully functional.
- Do not remove calculators, redesign the site, add a database, add sign-in, or change calculation formulas as part of this task.
- Do not invent a legal company name, postal address, privacy email, retention period, business jurisdiction, cookie behaviour, or consent record. Use existing verified contact hello@calnivocalc.com; if a legal fact needs owner confirmation, leave a clearly documented TODO and do not publish a false assertion.
- Update code, metadata and policy wording together. Do not only edit prose while leaving contradictory telemetry code active.

P0 — PRIVACY POLICY CONSISTENCY

1. Edit src/app/privacy/page.tsx. Remove the two contradictory Analytics sections and replace them with one accurate, detailed policy. The source currently loads GA4 Measurement ID G-L38QJ6QYWQ in src/app/layout.tsx; do not say that Calnivo does not use analytics.

2. Do not call GA4 data fully “anonymous” or “anonymized.” Do not claim “Do Not Track” opts a user out unless code implements and tests it. Do not promise that users can opt out through browser settings unless this is actually supported and clearly explained.

3. Explain separately: (a) calculator input/result processing, (b) GA4 usage/technical data and consent, (c) hosting provider technical request metadata, and (d) information users send when they email Calnivo.

4. Limit the “local processing” promise to calculator values and results, and only make the promise if network testing confirms no values/results are transmitted. Do not make a site-wide “no data collected/no tracking” claim.

5. Do not assert a specific GA4 or Netlify data-retention period until the owner has checked the actual account settings/provider policy. Explain that provider-managed retention follows the actual configuration and provider documentation.

6. Remove “Calnivo is safe for users of all ages.” State the real audience and avoid unsupported child-safety claims. Add a clear privacy-request route through hello@calnivocalc.com or /contact.

7. Change the “Last updated” date to the date the revised policy is actually published, not the date the coding agent starts.

P0 — CONSENT-GATED GA4

8. In src/app/layout.tsx, stop loading the Google Analytics script unconditionally on first page load. Implement a consent manager in a reusable component. Do not load gtag.js and do not set/read Analytics cookies until the user grants analytics consent in regions where prior consent is required. As the conservative default, require an explicit analytics choice before loading GA4 for any visitor.

9. Provide equally clear “Accept analytics” and “Reject optional analytics” choices; add “Manage preferences” if more categories exist. Store the preference only as needed, make it easy to change later, and add a persistent “Privacy settings” footer link/button. Make the banner keyboard-accessible, screen-reader labelled, mobile responsive, dismissible only through a meaningful choice, and visually consistent with Calnivo.

10. If using Google Consent Mode, implement it correctly, but do not treat Consent Mode by itself as user consent. A rejection must stop optional analytics according to the chosen consent architecture; test this with browser network tools and cookies.

11. Ensure GA4 collects only page-view/low-risk site-use events. Never send calculator inputs, outputs, health or finance details, generated passwords, email addresses, or sensitive free text as event parameters or URLs. Do not add form/input event tracking.

12. Test navigation in the custom SPA/client-side flow so route changes produce the intended number of page_view events, with no missed or duplicate views. Test first visit, accept, reject, withdraw/change preference, refresh and navigation.

13. Update CSP in next.config.ts only as needed for the consent implementation; retain the existing security protections and do not broadly loosen script-src/connect-src.

SITE-WIDE CLAIMS

14. Update src/components/layout/Footer.tsx: replace “Calculations run in your browser. No data collected.” with precise

wording explaining local calculator processing plus hosting and consented analytics. Keep a visible Privacy link and add a Privacy settings control/link.

15. Update src/app/calculators/page.tsx: remove “no backend, no database, no tracking.” Use an accurate, narrow statement such as “Calculator inputs and results are processed locally; see our Privacy Policy for hosting and analytics details,” after verifying input/result behaviour.

16. Review src/components/home/HomePage.tsx and src/app/layout.tsx metadata for broad privacy statements. “All calculations run in your browser” may remain only if true. Replace “Each calculator is tested for accuracy” unless every calculator is supported by a documented, repeatable test suite.

17. Review README.md only for accuracy where it is intended for public distribution; ensure it does not contradict the deployed privacy statements.

TERMS, DISCLAIMER, ABOUT, CONTACT

18. Edit src/app/terms/page.tsx to clarify that outputs are estimates that depend on formulas, input assumptions, date/tax year and jurisdiction; keep financial/medical/legal advice disclaimers; qualify liability limitations by applicable law; add reasonable acceptable-use and IP/use terms; improve the change/effective-date language. Do not invent governing law or suggest statutory rights are waived.

19. Create src/app/disclaimer/page.tsx with a dedicated Financial, Health, Mathematical and General-Use Disclaimer. Include finance/tax jurisdiction and date limitations; health metrics are not a diagnosis; pregnancy-related results are estimates; construction/network/date/time outputs require input/unit verification. Link this page from the footer and relevant calculators.

20. Update src/components/layout/Footer.tsx to include Disclaimer and persistent Privacy settings links. Keep all existing links. Ensure every link is a real crawlable anchor/Next Link and does not break the route.

21. Update src/app/sitemap.ts to include /disclaimer. Keep the existing /privacy, /terms, /contact and /about entries. Confirm all policy routes have HTTP 200, self-referencing canonicals and are indexable.

22. Review src/app/about/page.tsx and src/app/contact/page.tsx: ensure the responsible operator/contact wording is accurate. Use hello@calnivocalc.com for privacy enquiries unless a dedicated monitored privacy address is actually created. Do not claim registered-entity status without confirmation.

23. Do not add AdSense copy or claim ads are already active. The inspected root layout currently shows GA4, not an AdSense script. Add advertising/cookie disclosures and configure the required consent solution only when AdSense is actually integrated. Before serving ads in the EEA/UK/Switzerland, check Google’s latest certified CMP / IAB TCF requirements.

VERIFICATION — DO NOT SKIP

24. Build the site and run lint/type checks. Preserve all 40 calculator routes.

25. Inspect rendered /privacy, /terms, /disclaimer, /about, /contact, /calculators and homepage content for contradictory claims. Check the final deployed commit after deployment.

26. Using browser network tools, confirm a first-time visitor who has not accepted analytics causes no gtag.js request and no Google Analytics request/cookies under the consent architecture; accepting causes only the expected measurement traffic; rejecting or withdrawing prevents subsequent optional analytics; calculation values/results/passwords never appear in requests, event payloads or URLs.

27. Check keyboard navigation, contrast, mobile banner layout, focus management, and the footer links. Verify sitemap.xml lists the new disclaimer URL.

28. Return a concise implementation report: files changed, build/test results, what remains owner-confirmation-only, and whether live network tests were actually run. Do not claim compliance or successful testing that was not performed.

9. Release Acceptance Checklist

☐ Privacy Policy contains exactly one Analytics section and truthfully names Google Analytics 4 if enabled.

☐ No “no tracking” / “no data collected” claim remains while GA4 is active.

☐ GA4 does not load before consent where required; reject and withdrawal states work.

☐ No financial/health calculator inputs, calculation results or generated passwords are sent to Google Analytics.

☐ Network tests confirm calculator input/result values remain client-side.

☐ Actual GA4 data retention and any enabled analytics features were reviewed by the owner.

☐ Terms page keeps the not-advice and estimate limitations and avoids unsupported claims.

☐ Dedicated Disclaimer page exists and is linked from footer and relevant tools.

☐ Footer includes Privacy, Terms, Contact, About, Disclaimer and Privacy settings.

☐ Sitemap includes all policy pages; routes return 200, are indexable and have correct canonicals.

☐ No fake business identity, privacy email, location, retention period or legal claim was inserted.

☐ Build/lint/type checks pass; all 40 calculators still function; responsive and accessibility checks pass.

☐ If AdSense is added later, advertising disclosures and appropriate certified CMP requirements are completed before ads serve in relevant regions.

☐ Privacy Policy “Last updated” date matches the actual publication/revision date.

10. Audit Evidence and Source Links

Primary code evidence: public repository files reviewed for this report. Click a file link to inspect the corresponding source.

- Privacy policy source
- Terms source
- Global GA4 integration
- Footer claims and links
- Calculator directory content
- Homepage trust statements
- About page
- Contact page
- Sitemap
- Security headers / CSP

Audit status note: the code-level contradictions described above are confirmed in the inspected main-branch source. Whether the current production deployment includes exactly the same code and how the GA4 property is configured must be rechecked in production before final publication.
