CALNIVO

Complete Fix Guide for the Google AdSense “Low value content” Rejection

Every problem found on calnivocalc.com, why it matters, and exactly what to change, with ready-to-use replacement text, code and a resubmission checklist.

Item	Detail
Website	https://calnivocalc.com (Next.js on Netlify)
Repository	github.com/mohammedtech121/Calnivo
AdSense publisher ID	ca-pub-4136175675290701
AdSense status	“Your site isn’t ready to show ads”; ownership verified; policy violation: Low value content
Prepared	7 November 2026
Basis	Live pages read on 7 Nov 2026; every worked example recalculated with independent code; Google’s consent policy checked. GitHub blocks automated reading of repository sub-pages, so code-level items are marked **Check in repo**.

Note: Your pasted audit brief stopped in the middle of Section 9 (technical SEO). This guide covers every item in the brief up to that point. If the brief had more checks after that, send them and they can be added.

How to read this guide

- **Fixes are numbered 1–16** and grouped in six parts: content, accuracy, trust, privacy, technical, resubmission.
- Each fix gives the problem, why it matters, the exact change, and a “Done when” test so you know it is finished.
- **Confirmed** = seen on the live site or proven by recalculation. **Check in repo** = comes from your earlier repo audit and must be confirmed in the code before editing.
- Nobody can guarantee approval. The goal is to remove every defect a reviewer could point to and to make the site clearly useful on its own.

Summary

Why the site is being rejected

The calculators themselves are real and mostly work. The rejection is about everything around them. Google sees 40 pages that share one generic text block, several pages whose text promises features that do not exist, worked examples that are mathematically wrong, claims of testing that nothing on the site backs up, and a homepage paragraph that appears to be copied from another calculator site. Together this reads as thin, mass-produced content, which is what “Low value content” means.

Google’s message asks for three things. This is how Calnivo stands against each:

Google asks for	Where Calnivo falls short	Fixes
Authentic, high-quality information, tools or services	Templated text; wrong examples; promised features missing; copied homepage text; no sources	1–5, 7–12
Ongoing curation and structural maintenance	Five posts all dated October 2026; 2024 tax tables in late 2026; no review dates or corrections; repo clutter	6, 10, 13, 15
Genuine, sustained user interest	Cannot be judged from outside; new site. Check Search Console for indexing and impressions	15, 16

Priority order

Priority	When	What
P0 Stop the damage	Days 1–3	Fix wrong numbers and the mortgage result sentence (7, 8); remove unsupported feature claims (9); reword “verified/tested” claims (13); rewrite copied homepage text (3); fix “Calculator inputs collected.” (14); delete “People also search for” (2)
P1 Build real value	Weeks 1–3	Rewrite 12–15 best calculators (1, 4); noindex the rest; update income tax (10); fix terminology (11); add tests and CI (12); methodology page (13); history wording in privacy policy (14); About page and authorship (6); per-page metadata (15)
P2 Finish and prove	Weeks 2–4	Certified consent platform for Europe (14); 8–10 original articles (5); technical checks and Search Console review (15); repo clean-up (15)
Then	3–4 weeks after the last fix is live	Resubmit once (16)

PART A — CONTENT

Fix 1. Replace the repeated text template with real, per-calculator content

PRIORITY P1 · Main cause of rejection · Confirmed on 8 live pages

Problem

Mortgage, Loan, BMI, Income Tax, Due Date, Concrete, Conception and Ideal Weight all use the same six blocks: “What is…”, Formula, How to use, Example, four FAQs, “People also search for”. Definitions are generic (for example “A loan calculator is a free online tool that estimates…”), and the steps only repeat the field labels. A shared layout is fine. The problem is that the words are interchangeable: swap the calculator name and the paragraph still reads the same.

Why it matters

Google’s helpful-content guidance rewards pages that give a visitor something the calculator alone does not: how to read the result, what assumptions it makes, and where it breaks down. Repeated boilerplate across 40 pages is the textbook shape of low-value, auto-generated content.

Exact change

Keep the page layout but replace the six generic fields with these seven. Every field must be written separately for each calculator. Files to change (from your earlier audit; **Check in repo**): `src/lib/calculators/registry.ts`, `src/components/calculator/CalculatorSeoContent.tsx`, `src/app/calculators/[id]/page.tsx`.

New block	What it must contain	Rule
1. Result guide	What each output means, with 2–3 realistic scenarios and what moves the answer most	Uses real numbers, not adjectives
2. Method and assumptions	The formula, compounding or rounding used, and what is left out (taxes, fees, insurance)	Matches the code exactly
3. Worked example	Inputs and outputs produced by the same function the calculator uses	Never typed by hand
4. Limits and common mistakes	When the result misleads (BMI for athletes, old tax tables, LMP dating with irregular cycles)	At least 3 points
5. Specific FAQs	4 or more questions that only apply to this tool	No answer reused on another page
6. Sources	2–3 primary sources: IRS, CFPB, CDC, ACOG, NIST, WHO	Link to the exact page
7. Review line	“Last reviewed: date” and a link to report an error	Update only after a real recheck

Suggested data model (adjust to your real types):

```
type CalculatorContent = {
  resultGuide: string[];                      // paragraphs about each output
  method: { formula: string; assumptions: string[]; excludes: string[] };
  exampleInputs: Record<string, number>;      // outputs computed by the real function
  limits: string[];
  faqs: { q: string; a: string }[];           // unique per calculator
  sources: { title: string; url: string }[];
  lastReviewed: string;                       // ISO date, e.g. "2026-11-20"
};
```

Model text: Mortgage calculator (every number below is recalculated and verified)

Model: What your result means. The monthly figure is principal and interest only unless you turn on taxes, insurance and HOA. On a $320,000 loan at 6.5% over 30 years, principal and interest is **$2,022.62** a month. In month one, $1,733.33 of that is interest and only $289.29 reduces the loan, which is why balances fall slowly at first.

Term trade-off. The same loan over 15 years costs **$2,787.54** a month, $764.92 more, but total interest falls from $408,142.36 to $181,757.84, a saving of $226,384.52.

Extra payments. Adding $200 a month to the 30-year loan pays it off in 281 months (23 years 5 months) and cuts interest to $302,713.69, saving $105,428.67. *Use this paragraph only after the extra-payment input exists (Fix 9).*

Limits. This is an estimate. Your lender's quote can differ because of rounding, fees, mortgage insurance and the exact day payments start. Adjustable-rate loans change over time and are not modelled.

Sources. CFPB: owning a home and mortgage basics (consumerfinance.gov/owning-a-home/mortgage-basics/).

Done when

Reading any calculator page, a stranger could not swap in another calculator's name and have the text still make sense, and every number on the page matches what the tool outputs.

Fix 2. Delete every "People also search for" block

PRIORITY P0 · Confirmed on every page read

Problem

Each page ends with 7–8 search phrases (for example the Income Tax page lists "state income tax calculator" and "self employment tax calculator", which the site does not offer; the Loan page lists "debt consolidation calculator"). They are phrases, not information.

Why it matters

It reads as keyword stuffing and promises tools that do not exist, which also contradicts the page.

Exact change

Remove the related-searches field and its render from the shared SEO component and from every calculator entry in the registry. Do not replace it with another list of phrases. If you want internal links, keep one short "Related calculators" block (see Fix 15).

Done when

A search of the repo for the old field name returns nothing and no live page shows the heading.

Fix 3. Rewrite the homepage paragraph that appears copied from Calculator.net

PRIORITY P0 · Needs a plagiarism check to confirm

Problem

The homepage section "One-stop, go-to site for quick calculations" follows the introduction used by Calculator.net almost sentence for sentence: the focus statement, the "do the math" line, the goal of becoming the one-stop site, and the belief that the internet should be a source of free information. Only the site name and calculator count differ. A page in PolyU's library repository carries the same goal and free-information sentences. The README's "© 2008–2026" matches Calculator.net's footer, which starts in 2008, and the README calls the project "Calculator.net-style".

Why it matters

Copied or scraped text is a separate AdSense content problem from thin content, and a new site claiming a 2008 start date harms credibility.

Exact change

Replace the paragraph with your own wording. Draft below; edit it so every sentence is true for Calnivo:

> **Draft:** Calnivo is a set of free calculators for money, health, math and everyday tasks. Each one runs in your browser, shows the formula it follows, and explains what the result means so you can check it against your own situation. We are a small team and we add and recheck tools over time. If you find a mistake, tell us and we will correct it and note the change.

- Change the README line "© 2008–2026" to the real start year (for example "© 2026 Calnivo") and remove "Calculator.net-style".
- Run the homepage, the About page and several calculator pages through a plagiarism checker. If anything else matches another site, rewrite it.

Done when

The paragraph is original, the README year is correct, and a plagiarism check of the homepage returns no close matches.

Fix 4. Reduce the thin surface: rewrite your best pages first, noindex the rest

PRIORITY P1

Problem

Forty near-identical pages is more than the site can support with real content right now, and some tools overlap: Loan, Payment, Auto Loan, Finance (TVM) and Amortization; Interest and Compound Interest; Pregnancy, Due Date and Pregnancy Conception.

Exact change

Rewrite in three waves. Adjust the lists using Search Console impressions once you have them (these are suggestions).

Wave	Calculators	Action
A: rewrite first (weeks 1–3)	Mortgage, Loan, Auto Loan, Compound Interest, Retirement, Income Tax, BMI, Calorie, BMR, Due Date, Percentage, Age, Scientific	Full new structure from Fix 1
B: rewrite next	Amortization, Investment, Salary, Inflation, Interest, Payment, Pregnancy, Body Fat, Ideal Weight, Fraction, GPA, Grade, Date, Conversion	Rewrite when A is done; noindex until then
C: noindex or merge	Concrete, Subnet, Hours, Time, Random Number, Password Generator, Pace, Triangle, Standard Deviation, Finance (TVM), Interest Rate, Sales Tax, Pregnancy Conception	Noindex until rewritten; consider merging near-duplicates

To keep a page usable but out of Google's index (Next.js App Router), add this to the calculator page and remove those IDs from the sitemap:

```
// src/app/calculators/[id]/page.tsx
const NOT_READY = new Set(["concrete", "subnet", "hours", "time", "random-number"]);

export async function generateMetadata({ params }: { params: Promise<{ id: string }> }) {
  const { id } = await params;
  return {
    // ...your existing title, description, canonical...
    robots: NOT_READY.has(id)
      ? { index: false, follow: true }
      : { index: true, follow: true },
  };
}

// src/app/sitemap.ts: skip the same IDs
const urls = calculators.filter((c) => !NOT_READY.has(c.id)).map(/* ... */);
```

Done when

Only rewritten, accurate pages are indexable, and the sitemap lists the same set.

Fix 5. Strengthen the blog with original, sourced articles

PRIORITY P1–P2

Problem

Five articles, all dated October 2026. The mortgage article (about 700 words by estimate, labelled “8 min read”) repeats the wrong example ($2,022.82 / $728,215 / $408,215), uses 6.5% while the calculator opens at 6.8%, and cites two general pages (CFPB mortgage basics and an Investopedia page about mortgages in general, labelled “Mortgage Payment Formula”). The article mostly leads to the calculator and gives no comparison or data a reader could not find elsewhere. The other four (BMI, compound interest, retirement, calories) were not read and need the same review.

Exact change

1. Correct the mortgage article numbers: **$2,022.62** a month, **$408,142** interest, **$728,142** total, and say which rate the calculator opens at.
2. Review the other four articles for wrong numbers, unsourced medical or financial claims, and outdated figures.
3. Cite the specific primary page for each fact (the exact CFPB page, IRS publication, CDC or ACOG page).
4. Fix the reading-time label or compute it from the word count.
5. Publish 8–10 new articles before resubmitting, each with a point of view and real figures. Verified examples you can use are below.
6. Add a visible published date, a “Last reviewed” date and one named author to every article.

Article idea	Verified figures to build on
15-year vs 30-year mortgage	$320,000 at 6.5%: $2,787.54 vs $2,022.62 a month; interest $181,757.84 vs $408,142.36
What an extra $200 a month really does	Same loan: payoff in 281 months, interest $302,713.69, saving $105,428.67
Longer loan, lower rate: which costs less?	Per $10,000: 36 months at 9% costs $1,447.90 interest; 72 months at 6% costs $1,932.48
Nominal vs effective interest rate	12% nominal compounded monthly = 12.68% effective
Does compounding frequency matter?	$10,000 at 5% for 10 years: yearly $16,288.95; monthly $16,470.09; daily $16,486.65
How concrete bag counts are really worked out	10 ft x 10 ft x 4 in slab = 33.3 cu ft: 55.6 bags exact, 62 with 10% waste (80 lb, 0.6 cu ft each)

Article idea	Verified figures to build on
How due dates are calculated	Naegele’s rule (LMP + 280 days), cycle adjustment, why ultrasound can change the date; IVF dates from transfer
Why BMI misleads some people	Athletes, older adults and children; screening tool, not a diagnosis (cite CDC)
How federal tax brackets work in 2026	Marginal vs effective rate with a worked example from the current IRS tables (Fix 10)
Password length vs complexity	16 characters from 94 symbols = about 104.9 bits of entropy (length x log2 of pool size)

Done when

Each article contains figures, tables or comparisons you can defend, links to specific sources, and shows its author and review date.

Fix 6. Make the About page and authorship credible and consistent

PRIORITY P1

Problem

Each founder’s bio is one generic sentence. The mortgage article says “Written by Mohammed Khan, Founder” and “Reviewed by Hammad Khan, Founder”, so the reviewer is not independent. Metadata names Hammad Khan as author on legal and blog pages but Mohammed Khan as article author on calculators. The About page promises “repeatable testing” and “transparent assumptions” that the site does not yet show.

Why it matters

Finance and health content is held to a higher standard. Reviewers look for who is behind the advice and whether the site is accountable for its accuracy.

Exact change

1. Rewrite each bio with facts: what the person has studied or built, why they made Calnivo, and what they are responsible for. **Do not claim credentials you do not have.**
2. Use one named author per page, in both the visible byline and the metadata.
3. For medical or financial advice pages, consider having a qualified outside reviewer and name them with their real qualification. If you cannot, do not label pages “reviewed”.
4. Add an “Editorial and corrections policy” page: how content is written, how numbers are checked, how to report an error, and a dated corrections log.
5. Keep the contact page working with a real monitored address (hello@calnivocalc.com is listed in the policy).

Done when

A first-time visitor can tell who runs the site, how it is kept accurate, and how to report a mistake.

PART B — ACCURACY

Fix 7. Correct every wrong worked example

PRIORITY P0 · Confirmed by recalculation

Problem

In most cases the live calculator is right and the written example beside it is wrong, which still destroys trust. All values below were recomputed with independent code.

Calculator	Replace this	With this	Status
Mortgage ($320,000, 6.5%, 30 yr)	$2,022.82/mo; interest $408,215; total $728,215	**$2,022.62/mo; interest $408,142.36; total $728,142.36**	Confirmed on mortgage page and blog article
Loan ($25,000, 9.5%, 60 mo)	$525.13; interest $6,507.80; total $31,507.80	**$525.05; interest $6,502.79; total $31,502.79**	Confirmed on live page
Payment ($15,000, 8%, 36 mo)	$470.01; interest $1,920.36; total $16,920.36	**$470.05; interest $1,921.64; total $16,921.64**	Math confirmed; page not opened
Age (15 Jun 1995 to 20 Nov 2024)	10,755 days; 258,120 hours	**10,751 days; 258,024 hours** (29 years 5 months 5 days is correct)	Math confirmed; page not opened
Concrete (10x10 ft, 4 in, 80 lb bags)	“With a 10% margin… about 56 bags”	**55.6 bags exact (56); 62 bags with 10% waste**. Volume 33.3 cu ft = 1.23 yd³; with 10% about 1.36 yd³	Confirmed on live page
Conception (due date 10 October)	About 25 January; window 20–27 January	**About 17 January** (18 January in a leap year); fertile window about 12–17 January (five days up to ovulation)	Confirmed on live page
Ideal weight, Robinson male, 5’9”	“50 + 1.9×9 = 69.1 kg”	**52 + 1.9×9 = 69.1 kg** (using 50 would give 67.1)	Confirmed; the tool is correct
Due date, IVF day-5 transfer	Transfer date + 266 days	**Transfer date + 261 days** (266 minus 5). Day-3 transfer + 263 days is correct	Confirmed by arithmetic; check against ACOG or clinic guidance before publishing
Interest rate example	$20,000, $482.66 for 48 months gives 7.42%	**$482.83 gives 7.42%.** The live example ($20,000, $400, 60 months, 7.42%) is correct	Confirmed

Exact change

1. Fix each example in `registry.ts` and in the blog article.
2. Search the whole repo and all live pages for the old figures so no copy survives: `2,022.82`, `728,215`, `408,215`, `525.13`, `6,507.80`, `470.01`, `10,755`, `258,120`, `482.66`, `January 25`, `50 + 1.9`.
3. Generate every example from code (Fix 12) so text and tool cannot disagree again.

Done when

A repo-wide search for the old values finds nothing, and each example on the page can be reproduced by typing its inputs into the live tool.

Fix 8. Fix the mortgage result text that contradicts itself

PRIORITY P0 · Confirmed on live page

Problem

The mortgage page shows **Total of Payments $751,017.82** in the result card, but the sentence under it says you will pay “approximately $431,017.82 in total payments, of which $431,017.82 is interest”. Interest is $431,017.82 and total payments are $751,017.82 (loan $320,000 + interest). The

chart caption repeats the same error.

Exact change

Use the correct figure in both the sentence and the chart caption (in `mortgage.tsx`; **Check in repo**):

```
const totalPayments = monthlyPI * termMonths;      // 751,017.82 in the live example
const totalInterest = totalPayments - loanAmount;  // 431,017.82

"Over the full term you'll pay approximately {fmt(totalPayments)} in total payments,
 of which {fmt(totalInterest)} is interest."
```

The Loan page also says interest is “23% of the original loan amount” in one place and “18.76% of your total payments” in another. Both are correct, but label them clearly: “23% of the amount borrowed” and “18.8% of everything you pay”.

Done when

Total payments and interest differ everywhere they appear, and total payments minus interest equals the loan amount.

Fix 9. Remove or build every feature the text promises but the tool lacks

PRIORITY P0 for text edits · P1 if you choose to build

Problem

Seven calculators describe inputs or results the live tool does not offer. The rule: nothing in the text may describe something the visitor cannot do on the page. Either delete the claim (fast) or build the feature (more valuable).

Calculator	Claim in the text	Live tool has	Option A: delete	Option B: build
Mortgage	Step 5: toggle PMI when down payment is under 20%; FAQ and blog discuss PMI	Price, program, down payment, rate, one taxes/insurance/HOA toggle. No PMI row	Remove step 5 and PMI sentences in the description and FAQ	Add PMI rate input (% of loan a year) applied when down payment is under 20%; add a PMI row to the breakdown
Loan	Step 4: add extra monthly payment; “model extra payments”	Amount, rate, term, unit	Remove step 4 and the phrase	Add extra-payment input; show new payoff time and interest saved
Income tax	Steps 2–4: married filing separately, credits, extra deductions, state tax rate	Single, married jointly, head of household. A page note says credits and state tax are excluded	Rewrite the steps (see below)	Add filing status and tax-year selector; leave credits and state tax out
Interest rate	Step 5: add fees for true APR	Loan amount, monthly payment, term	Remove step 5	Add upfront-fee input and define how fees affect APR
Pregnancy conception	Enter due date, last period or birth date; optional cycle length	Toggle: due date or birth date; no visible cycle input	Match text to inputs	Add an LMP mode and a cycle-length input
Due date	IVF transfer-date formula and FAQ	LMP and cycle length only	Remove IVF lines, or keep as a short sourced note	Add a transfer-date mode with embryo age
Concrete	Steps and curbs mentioned in the description	Slab, footing, square column, round column	Remove “steps and curbs”	Add step and curb shapes

Replacement wording for the income tax steps:

> **Replace with:** 1. Enter your taxable income (after deductions and pre-tax contributions). 2. Choose your filing status: single, married filing jointly or head of household. 3. Choose the tax year. 4. Review federal tax owed, marginal rate and effective rate. State tax, credits and other taxes are not included.

Still to check (your audit flagged them; not opened for this guide): Payment (“flexible compounding”), Investment (monthly and annual contributions), Sales Tax (multiple tax rates). Open each page and try every sentence in the description, steps and FAQ on the live tool. Also change the instruction “Click Calculate” (BMI, due date, conception, concrete and others) to “results update as you type”, because the live tools show no Calculate button.

Verified example for the Loan extra-payment feature (if you build it): $25,000 at 9.5% over 60 months is $525.05 a month. Adding $50 a month pays it off in 54 months, with interest of $5,764.64, saving $738.15.

Done when

A person following your “How to use” steps and FAQ can do every action on the live tool.

Fix 10. Update the income tax calculator from 2024 to current IRS tables

PRIORITY P1 · Confirmed outdated

Problem

The page uses 2024 brackets and says it uses “the current IRS tax brackets”. The 2024 math is correct ($13,753 on $85,000 single; $17,053 on $100,000; $13,841 on $85,400), but it is November 2026, so 2024 is two tax years old. Tax year 2026 is the year being earned now (returns filed in 2027).

Exact change

1. Add 2025 and 2026 bracket tables, with a tax-year selector defaulting to 2026. Copy the tables directly from the IRS (Rev. Proc. 2025-32 for 2026) and confirm every figure at irs.gov before publishing.
2. Update standard deductions in the FAQ: 2025 is $15,750 single, $31,500 married jointly, $23,625 head of household; 2026 is $16,100, $32,200 and $24,150.
3. Spot checks from published sources: 2025 single brackets run 10% to $11,925, 12% to $48,475 and 22% to $103,350; 2026 single starts with 10% to $12,400 and the 37% bracket begins above $640,600.
4. Put the tax year in the page title, description and example, and remove the phrase “current IRS tax brackets” unless the year is shown next to it.
5. Regenerate the examples ($85,000 and $100,000) from the new tables using the calculator’s own function.
6. Add a limits note: federal income tax only; no state tax, credits, self-employment tax or additional deductions (for example the extra deduction for people 65 and over).

Done when

The page states its tax year everywhere, the numbers match the IRS tables, and the FAQ describes only what the tool does.

Fix 11. Correct terminology and explanations

PRIORITY P1

Calculator	Problem	Exact fix
Interest rate	The page calls the result “effective APR” but the formula multiplies the monthly rate by 12, which is a **nominal** rate. The listing description also says “effective interest rate”.	Relabel as “nominal APR”, or also show APY = (1 + r/12)^12 − 1 (12% nominal gives 12.68%). Change the registry description and meta description to match.
Conception	The tool draws a window of two days either side of conception. The FAQ says the fertile window is the five days before ovulation plus ovulation day.	Pick one definition and use it in the tool, text and example. The FAQ definition is the standard one.
Fraction	The formula describes the least common denominator as the least common multiple but also shows cross-multiplication by the product of denominators.	Show the LCD (lowest common multiple of the denominators) in the step-by-step and explain that the product of denominators is a valid but not always smallest common denominator. **Check in repo** that steps match the code.
Password generator	Strength may assume a fixed pool size that differs from the characters actually available. **Check in repo.**	Entropy = length x log2(pool size), where the pool is exactly the sets the user ticked (16 characters from 94 symbols is about 104.9 bits). Explain the thresholds used for “weak/strong”. Confirm passwords are generated with `crypto.getRandomValues`, not `Math.random`.

Done when

Each label names exactly what the code computes.

Fix 12. Add automated tests and generate examples from code

PRIORITY P1 · Check in repo

Problem

Your earlier audit found no calculator unit tests: `package.json` has only dev, build, start and lint, and `tests/` holds shell scripts. The Terms say each calculator is tested. Missing tests in the repo do not prove checking never happens, but nobody can see it.

Exact change

1. Add a test script and one independent reference case per calculator. Take the expected values from an official source or a spreadsheet function such as PMT. The values below are verified.
2. Run the tests in GitHub Actions on every push.
3. Compute each worked example by calling the real function and inserting the result into the page text.
4. Test dates across a leap year and a month end (age, due date, conception).

```
// package.json  ->  "scripts": { "test": "bun test", ... }
// tests/calculators.test.ts  (adjust imports to your real function names)
import { describe, expect, test } from "bun:test";
import { monthlyPayment } from "@/lib/calculators/loan-math";   // illustrative path

describe("amortization reference cases", () => {
  test("mortgage 320k, 6.5%, 30y", () => {
    const m = monthlyPayment(320000, 0.065, 360);
    expect(m).toBeCloseTo(2022.62, 2);
    expect(m * 360 - 320000).toBeCloseTo(408142.36, 1);
  });
  test("loan 25k, 9.5%, 60m", () => {
    expect(monthlyPayment(25000, 0.095, 60)).toBeCloseTo(525.05, 2);
  });
  test("payment 15k, 8%, 36m", () => {
    expect(monthlyPayment(15000, 0.08, 36)).toBeCloseTo(470.05, 2);
  });
});
```

```
# .github/workflows/test.yml
name: test
on: [push, pull_request]
jobs:
  test:
    runs-on: ubuntu-latest
    steps:
      - uses: actions/checkout@v4
      - uses: oven-sh/setup-bun@v2
      - run: bun install --frozen-lockfile
      - run: bun test
      - run: bun run lint
```

Done when

bun `test` passes locally and in CI, with at least one reference case for every calculator you keep indexed.

PART C — TRUST

Fix 13. Make trust claims true, or reword them

PRIORITY P0 for wording · P1 for the methodology page

Problem

The site says its formulas are verified and tested, but a visitor cannot see evidence of either, and Fix 7 shows at least nine wrong examples.

Where	Current claim	Replace with (until you can prove it)
Homepage, “Why Calnivo?”	Trusted logic. Formulas verified against authoritative references.	Standard formulas. Each calculator lists the formula and sources it follows.
Terms of Use	We test each calculator for accuracy and review the formulas regularly.	We aim to make calculations accurate and correct errors when we find or are told about them.
About page	Use appropriate formulas, transparent assumptions and repeatable testing.	Use standard formulas, state our assumptions on each page, and correct mistakes openly.
Homepage	“No ads in the way”	Make this agree with the privacy policy, which says AdSense ads may appear. Remove the phrase or say where ads appear.

Once Fix 12 is live you can restore stronger wording, for example: “Each calculator is checked against reference examples before release; see our methodology page.”

Add a public Methodology and accuracy page containing:

- A table of every calculator: formula, source, date last checked, known limits (for example “federal income tax only”).
- How examples are produced (from code) and how tests are run.
- A “Report an error” route and a dated corrections log.
- A link to this page from the footer and from the Terms.

Done when

Every public claim about testing or verification can be backed by something a visitor can open.

PART D — PRIVACY AND CONSENT

Fix 14. Fix privacy wording, local history disclosure and the consent set-up

PRIORITY P0 for the broken sentence · P1–P2 for the rest

Issue	Evidence	Fix
Broken sentence	The All Calculators page intro ends “Calculator inputs collected.” (confirmed), the opposite of the policy	Change to “Calculator inputs are not collected.”
History stored locally but policy says none is collected	Policy: “We do NOT collect or transmit… calculation history”. Earlier audit: `LocalHistory.tsx` saves summaries and timestamps in localStorage as `calnivo:history`. Policy only mentions `calnivo:consent`. **Check in repo**	Add the section below and reword to “not sent to us”
Banner labels vs behaviour	Policy says AdSense and GA4 both wait for consent; earlier audit says buttons read “Accept analytics” and “Reject” with one shared state. **Check in repo**	Label the choice “Accept analytics and advertising”, or give two separate toggles; update the policy sentence about “analytics tracking”

Issue	Evidence	Fix
No certified consent platform	Google requires a certified CMP integrated with IAB TCF for personalized ads in the EEA and UK (from 16 Jan 2024) and Switzerland (from 31 Jul 2024). A custom banner storing `calnivo:consent` is not on Google's list	See below

Draft privacy-policy section for local history (confirm every detail against the code before publishing):

> **Draft: Calculation history on your device.** Some calculators can save a short summary of recent results (the calculator name, a summary of the result and the time) in your browser's local storage under the key calnivo:history. This stays on your device and is not sent to Calnivo, Google or anyone else. It is kept until you press "Clear history" or clear your browser data. We do not save generated passwords or [list any other fields you exclude].

Also change the sentence "We do NOT collect or transmit… calculation history" to "Calculator inputs and results are never sent to us." Consider adding a visible Clear history button and an off switch, and never saving generated passwords or health measurements.

Consent for Europe

1. **Easiest:** in AdSense, open Privacy and messaging and create the European regulations message. Google's own CMP (Google LLC, TCF ID 300) is on its certified list and is free.
2. **Alternatives:** a certified third-party CMP such as Sourcepoint, Usercentrics, OneTrust/CookiePro, Osano or CookieYes (check the live certified list on Google's help page before choosing).
3. Load AdSense through the CMP and use Google consent mode for GA4 so analytics also respects the choice.
4. Google states that only traffic from a certified CMP is eligible for personalized ads. Other traffic may get non-personalized or limited ads.
5. Test withdrawal: the footer "Privacy settings" link must actually stop the scripts and remove the cookies.
6. Confirm AdSense is not blocked everywhere until a click if you want ads outside Europe (**Check in repo**).

Done when

The policy describes every storage key and script that exists, the banner says what its buttons control, and EEA, UK and Swiss visitors see a certified consent message.

PART E — TECHNICAL

Fix 15. Technical SEO, metadata and repository clean-up

PRIORITY P1–P2

The basics are sound: full calculator text, FAQs and links are visible to crawlers, canonicals are present and correct, titles are unique, and all calculators, the blog and legal pages are linked from the homepage or footer. These items need fixing:

Issue	Confirmed finding	Exact fix
Wrong social/OG tags	Privacy, Terms, All Calculators, Blog and the mortgage article carry the homepage's OG title, description and URL	Add per-page `generateMetadata` with its own title, description, URL (code below)
Inconsistent author	Hammad Khan on legal/blog pages; Mohammed Khan as article author on calculators	One named author per page
Title pattern	Mortgage uses a shorter suffix than Loan, BMI, Income Tax	Use one pattern
Duplicate link blocks	Each calculator page has "More … calculators" twice (7 links, then 6)	Keep one block
Weak default inputs	Concrete opens at 0.23 cu ft and 1 bag	Open every tool on a realistic example
Keywords meta	A keywords meta tag is present on the homepage, blog and some calculators	Remove; Google ignores it and it reads as stuffing
Structured data	FAQ and breadcrumb JSON-LD reported (**check in repo**). FAQ rich results are now limited to a few site types	Validate with Google's Rich Results Test; keep FAQ markup only if it matches visible text

```
// src/app/blog/[slug]/page.tsx  (same idea for privacy, terms, calculators index)
export async function generateMetadata({ params }) {
  const { slug } = await params;
  const post = getPost(slug);
  const url = `https://calnivocalc.com/blog/${slug}`;
  return {
    title: `${post.title} | Calnivo`,
    description: post.description,
    alternates: { canonical: url },
    authors: [{ name: "Mohammed Khan" }],          // one consistent name
    openGraph: { type: "article", url, title: post.title, description: post.description },
  };
}
```

Checks you must run yourself (could not be done from outside)

Check	How
sitemap.xml	Open https://calnivocalc.com/sitemap.xml: all kept calculators, blog posts and legal pages listed; noindexed pages absent
robots.txt	Open /robots.txt: crawling allowed, sitemap URL listed
ads.txt	AdSense expects /ads.txt. Add `public/ads.txt` with the line below if the AdSense dashboard shows an ads.txt warning
Search Console	Page indexing report: many "Crawled, currently not indexed" pages would confirm Google sees them as thin. Also review Performance for impressions
Speed and mobile	Run PageSpeed Insights on the homepage, mortgage page and one blog post
HTTPS and redirects	http, www and non-www variants must redirect to https://calnivocalc.com
Orphan pages	Re-check internal links after any noindex or merge

```
# public/ads.txt
google.com, pub-4136175675290701, DIRECT, f08c47fec0942fa0
```

Repository clean-up (Check in repo)

- Remove loose screenshots and files at the repo root (`*.png`, `worklog.md`, `.test-write`, `tool-results/`, `upload/`), and unused folders (`examples/websocket`, `mini-services`, `prisma`, `db`) given the README says there is no backend.
- Fix the README's "© 2008–2026", add a description and topics to the GitHub repo, and keep the README accurate.
- None of this affects AdSense directly, but it makes the project look maintained.

Done when

Every page has unique correct metadata, the technical checks above pass, and Search Console shows the key pages indexed.

PART F — RESUBMISSION

Fix 16. When and how to resubmit

Resubmit about **3–4 weeks after the last fix is live**, and only when every box below is ticked. Google publishes no official waiting period, so this is a practical rule: it gives crawlers time to re-read the changed pages and lets you add fresh content in the meantime. Request review **once**. A rejected request costs you time.

Pre-resubmission checklist

- ☐ All worked examples recomputed; old numbers searched out of the repo and blog (Fix 7)
- ☐ Mortgage result sentence and chart caption corrected (Fix 8)
- ☐ No page describes a feature the tool lacks; "Click Calculate" removed (Fix 9)
- ☐ Income tax uses current IRS tables and states the tax year (Fix 10)
- ☐ Terminology fixed: nominal APR, fertile window, fraction steps, password entropy (Fix 11)
- ☐ Test script runs in CI with a reference case per indexed calculator (Fix 12)
- ☐ "People also search for" removed everywhere (Fix 2)
- ☐ Homepage text is original and passes a plagiarism check; README year fixed (Fix 3)
- ☐ 12–15 calculators rewritten with the new structure; the rest noindexed or merged (Fixes 1, 4)
- ☐ 8–10 original, sourced articles with one consistent author (Fix 5)
- ☐ About page has real bios; editorial and corrections policy published (Fix 6)
- ☐ Trust claims reworded or backed up; methodology page live (Fix 13)
- ☐ Privacy policy covers local history; broken sentence fixed; certified consent platform active in EEA, UK and Switzerland (Fix 14)
- ☐ OG tags, authors and canonicals unique per page; sitemap, robots.txt and ads.txt checked; Search Console shows key pages indexed (Fix 15)

How to request the review

1. Open AdSense, go to Sites, and select calnivocalc.com.
2. Expand "We found some policy violations".
3. Tick "I confirm I have fixed the issues".
4. Press "Request review", then wait for the decision.

If it is rejected again

- Read the new message; it may name a different policy.
- Re-run Search Console. If key pages are still "Crawled, currently not indexed", they need more original depth.

- Add more genuinely useful content and fix what the review points to before requesting again.

Appendix

What was verified and what was not

Area	Verified on live pages or by calculation	Still needs checking
Calculator pages	Mortgage, Loan, BMI, Income Tax, Due Date, Concrete, Conception, Ideal Weight, Interest Rate	Payment, Age, Investment, Sales Tax, Fraction, Password Generator and the other ~28 pages
Site pages	Homepage, All Calculators, Blog index, mortgage article, About, Privacy, Terms	Other four blog articles, Disclaimer, Contact
Math	Mortgage, loan, payment, age, concrete, conception, ideal weight, interest-rate example, FAQ figures, 2024 tax figures	IVF day-5 rule against ACOG guidance; 2026 tax tables against the IRS
Repository code	README and file list only (GitHub blocks automated reading of sub-pages)	Components, registry, LocalHistory, ConsentBanner, tests, sitemap, robots
Technical	Rendering, canonicals, titles, OG tags, internal links	sitemap.xml, robots.txt, ads.txt, structured data, speed, redirects, Search Console

Sources

- Google consent management requirements for serving ads in the EEA, UK and Switzerland: support.google.com/admanager/answer/13554116
- 2025 and 2026 federal tax figures: Empower (empower.com/the-currency/money/income-tax-brackets) and Wisconsin Institute of CPAs (wicpa.org), both citing IRS Rev. Proc. 2025-32. Confirm at irs.gov before publishing.
- Similar text found on a PolyU library repository record (oer.lib.polyu.edu.hk/concern/works/c534fp149); Calculator.net footer shows “© 2008”.
- Live pages at calnivocalc.com read on 7 November 2026; all calculations recomputed with independent Python code.

This guide is a technical and content review, not a legal or financial opinion. Check legal, privacy and tax wording with a qualified professional where the stakes are high.
